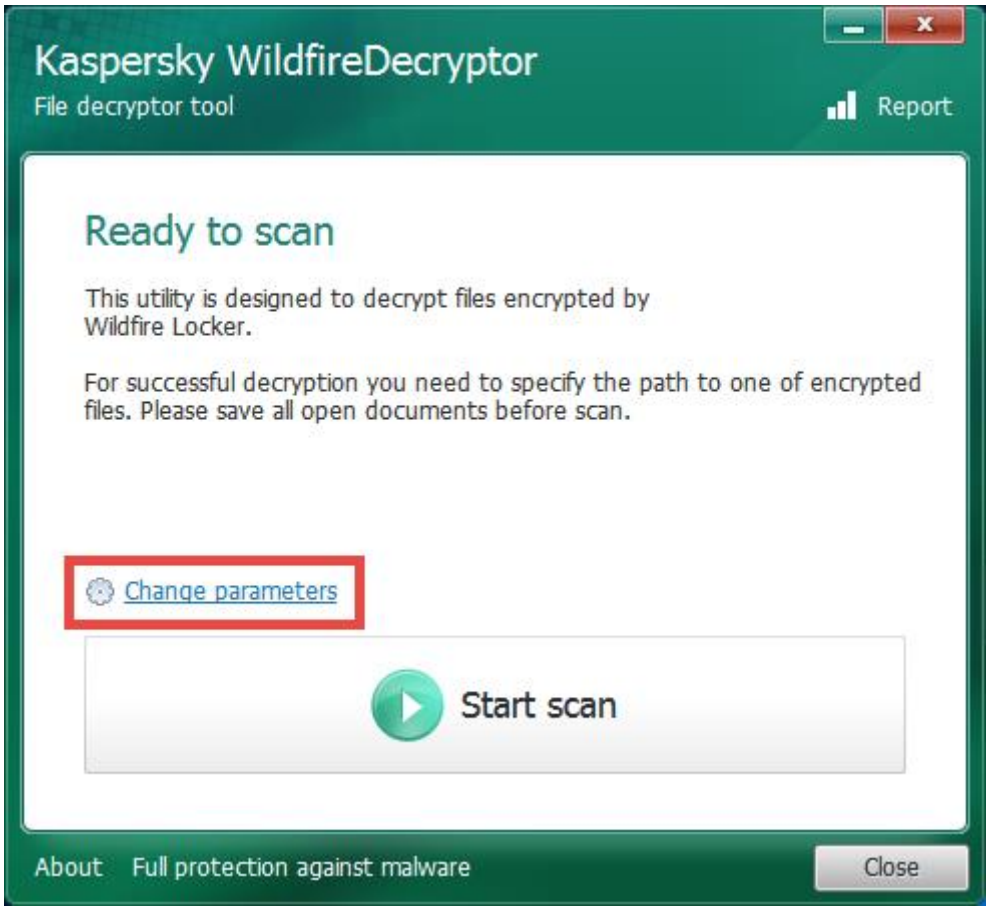
How-to guide.

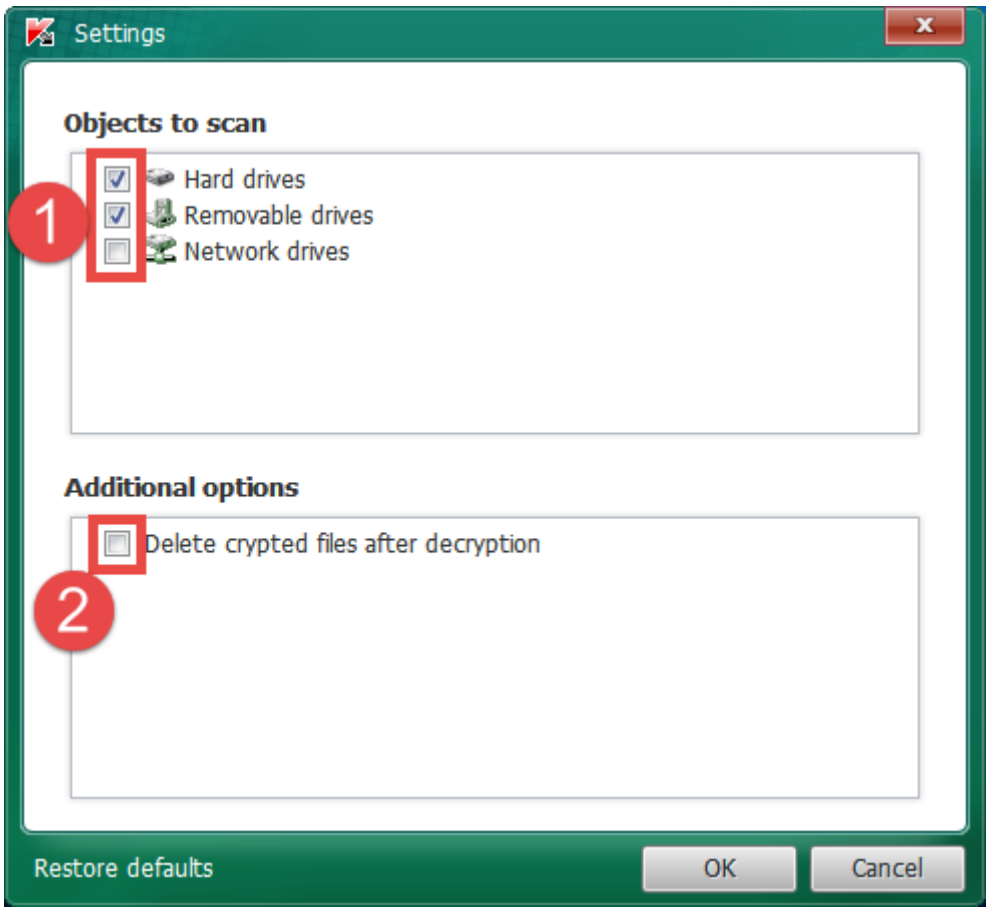
IMPORTANT! Make sure you remove the malware from your system first, otherwise it will repeatedly lock your system or encrypt files. Any reliable antivirus solution can do this for you.

1. Open and extract the **WildfireDecryptor.zip** archive, using an archiver (for example, **7zip**).
2. Double click the left mouse button at **WildfireDecryptor.exe**.

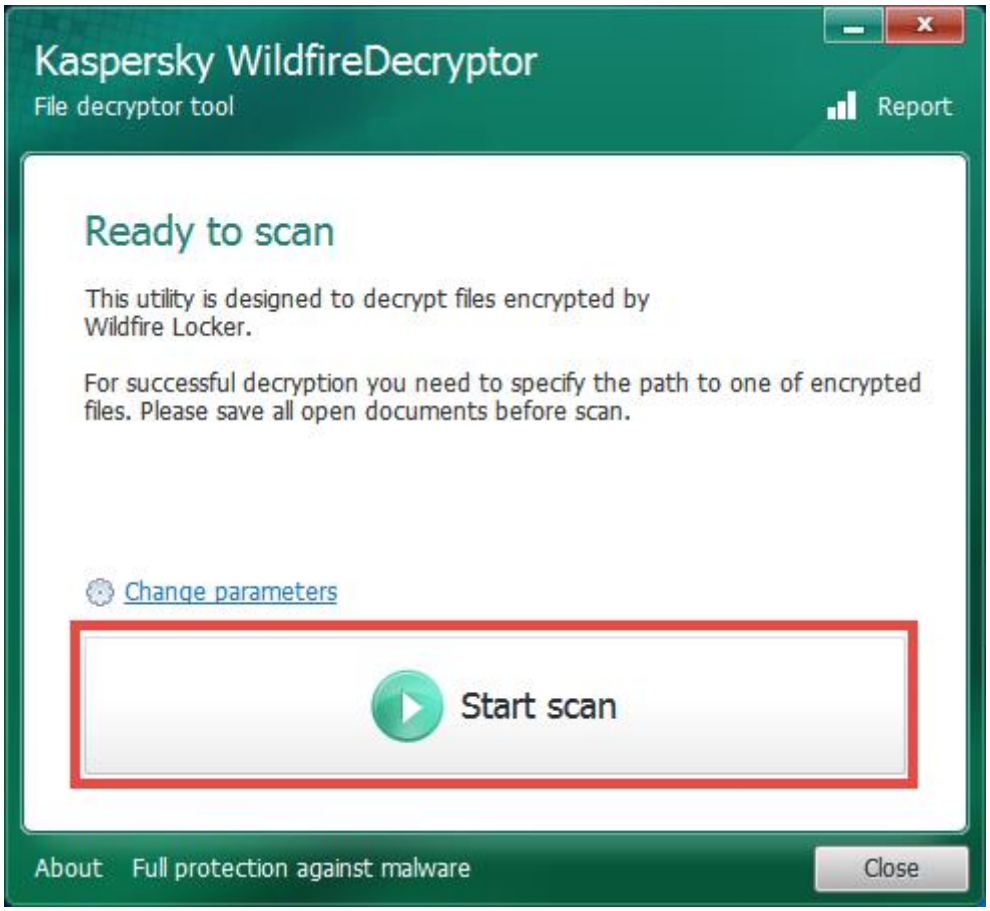
3. In the **User Account Control** (**UAC**) window, enter the password with the administrator permissions and click **OK**.
4. In the **Kaspersky WildfireDecryptor** window, specify the folders with the files to scan: click the **Change parameters** link.



5. In the **Settings** window, **Objects to scan** section, select the drives to scan. To remove encrypted files after the scan, select the corresponding check box in the **Additional options** section.
6. Click **OK**.



7. In the **Kaspersky WildfireDecryptor** window, click **Start scan**.



8. In the **Specify the path to one of encrypted files** select a folder for the file. Click **Open**.
9. To view information about the scan task, click **Details.**
10. To view the history of performed scans, in the upper right corner of the **Kaspersky WildfireDecryptor** window, click **Report**.
